

## Jeco Plastic Products For The Food and Water Industries

Food processors and water bottlers must be constantly on guard against contamination from myriad sources. One solution being implemented by more such processors every year involves the use of plastic pallets, bins and containers for both product storage and work-in-process. Jeco is a leading manufacturer of plastic products for food and water processing. Their smooth surfaces and lack of seams mean that plastic containers are easier and cleaner to use for food processing, and do not harbor harmful bacteria. Jeco plastic containers and pallets are easy to clean, with steam, high pressure water, or chemicals. They do not react chemically with foods or food additives.

Unlike pallets made from wood or other material, Jeco plastic pallets are virtually indestructible, and do not shatter in use or create splinters which jeopardize workers. They can be designed for specific uses—for example, to support the heavy weight associated with bottled water. The plastic molding processes used by Jeco permit inexpensively designing and manufacturing storage and product handling systems which are exactly tailored to the processing application. And Jeco pallets and containers are fully recyclable and never require special disposal methods.

Jeco plastics design engineers and manufacturing personnel have great depth of experience supporting food and water processors. For one major manufacturer, Jeco isolates storage facilities and equips dock doors with special insect-proof seals, ensuring that when shipped, the pallets shipped have been maintained in virtual clean room conditions. Let Jeco solve your unique food or water processing problem.
