

## Jeco Plastic Products For The Pharmaceutical Industry

Pharmaceutical manufacturers must maintain the highest levels of cleanliness and product purity throughout their operations. And every year, more and more rely on Jeco plastic products to ensure product integrity. Jeco plastic pallets are used by pharmaceutical manufacturers in both warehouse and production line environments. Jeco plastic bins and containers permit moving bulk pharmaceuticals with ease and confidence.

Jeco plastic pallets and containers cannot absorb moisture or fluids, and are impervious to virtually all known solvents. They are organic, but cannot rot or deteriorate with time. They are chemically inert, except in extremely high acid or alkali concentrations. Unlike pallets and containers made from wood or other material, Jeco products are smooth, which means there are no areas in which bacteria can grow. And antibacterial additives which actually kill bacteria can be included in the resin.

Jeco plastic pallets and containers are easy to clean. They are extremely durable, but if damage should occur—from a forklift penetration, for example—the inside surfaces are as resistant to mold and bacteria as the outside. Because they are made of plastic, Jeco pallets and containers are fully recyclable and never require special disposal methods.

The low tooling costs associated with the rotational and thermoforming molding processes used by Jeco means that pharmaceutical manufacturers can afford containers that are designed for a specific application, and improve operational efficiency. The long experience of Jeco design engineers, and their specific experience working in the pharmaceutical environment, can benefit manufacturers greatly. Jeco plastic pallets and containers typically demonstrate paybacks of only a few months.
